

## ***"MC-306 & DOT-406 DOME LEAK SIMULATOR"***

The STTS Dome Leak Simulator is shipped in its own aluminum storage box. Simply loosen the security screws and proceed with assembly. Once training is completed the unit can be disassembled, secured and stored until the unit is needed again!

The unit can be assembled within minutes and requires little to no technical expertise.

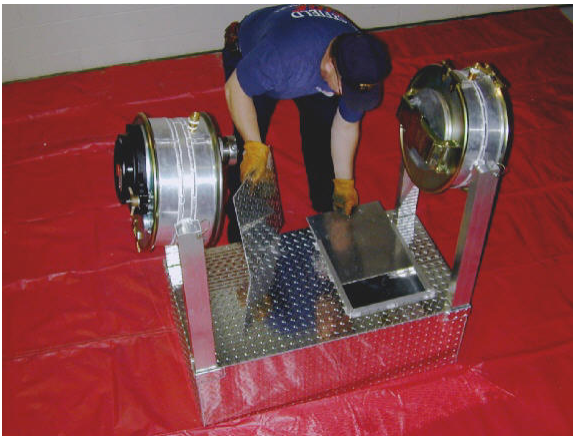

The dome lids themselves rotate for easy filling with water and can be secured at numerous angles to recreate roll-over angles.

After filling and pressurizing the cylinders with water, adjust the water pressure until a slight leak is created and begin practicing with dome clamps.

Each unit is equipped with a 3" NPT clean out collar and clean out cap for application of emergency unloading fixtures. Simply rotate the cylinder opposite of the 406 dome lid to access the clean out collar.

Finally, the top portion of the base unit is equipped with a removable aluminum plate that serves as stable platform to practice drilling. Each unit comes with two plates. Additional plates are available from STTS as needed. All plates are of equivalent thickness of gasoline cargo tanks.
